Emeritus Professor of Design, Department of Textile Printing, Dyeing and Finishing, College of Applied Arts, Helwan University  
Prof. Talaat Mahmoud Hassan  
Professor of Textile Printing, Dyeing and Processing Technology, Department of Technical and Industrial Education, College of Education, Helwan University  
Prof. Amal Abdel-Khaleq Awad  
Professor of Design, Department of Interior Design and Furniture, Faculty of Applied Arts, Helwan University  
Shaima Nabil Syed Awad Al-Jizawi  
Assistant Lecturer, Department of Technical and Industrial Education, College of Education, Helwan University

Abstract:
Computer programs at the present time, one of the most important things around me at this time, these things indicate that these ideas indicate that these ideas indicate an outward direction. Its place is a modern design, the beginning of its appearance in architecture where there are relationships and equations applied by the designer by means of programs dedicated to the computer "Grasshopper program". It started from who can obtain a limited number of units and designs by changing and transforming the combinations in one of the variables of these equations. Its versatile, powerful design ideas can easily be manipulated into 3D making it a lush field for continuous experimentation. It is considered the beginning of the application of parametric design direction in architecture. Parametric architecture can be a source of inspiration from which printed designs of female fabrics can be borrowed. It might seem somewhat surprising to use architecture as an inspiration for a textile print designer, but it could be the beginning of a different creative and new trend in the design of printed fabrics.

Keywords: Design system, Parametric design, Ladies Printed fabrics
