Clothing is not just an outer cover to cover some parts of the body or save it from the vagaries of the atmosphere or its adornment only, but that fashion has an inherent root at every nation civilization and all other affairs and is a sincere focus that reflects the social, economic, political, cultural, religious conditions through the ages and times. But often personal motives are within these influences (Yusri Moawad - 1995 - 3). It is recognized that women in general like to change all of her clothes and also like to modify or renew used clothes because of the high prices of clothing, it is possible to use simple additions such as buttons, lace and strips of elastic or belts to renew any used clothes to become a new model and innovative.

Since a product has a life cycle that ends as an exhaust, it should be disposed of, in several ways, such as incineration, resulting in air pollution, or in the manner of burial in the soil resulting in soil pollution. So recycling is considered very safe. (Thanaa Mustafa -2011- 497). As global attention to environmental issues and conservation increased, the issue of recycling emerged as one of the most important issues that many countries have been interested in and stimulated, and are striving to apply them in the right way, because they have great importance in economic development (Tahani Bint Nasser-2017-231). The idea of this research was to contribute to the recycling of the men's shirt and to employ it creatively in the fashion design, as well as to take advantage of the used clothes to reach a new formality in a creative way to get new fashion and to support the local economy. Its problem is summarized in this research in: 1. Is there awareness of the importance of recycling clothes and the desired benefit? 2. Is it possible to take advantage of the men's shirt in units with innovative designs to match the fashion lines? 3. How can recycling be used in our daily lives? The research objectives were: 1. Identify how to exploit the consumed parts to make other new products. 2. Linking scientific research to community service. 3. Developing creative abilities in designing and beautifying the uniforms by recycling the men's shirt. 4. Recycle the men's shirt in fashion design in a creative way. The main elements that highlight the importance of this research is to benefit from the research in the work of training courses to apply the results. Recycling is a nouha for small projects, which contributes to increase the income of the family and contribute to the provision of a product more economical and new and high quality and it serves the labor market as it helps to find more jobs for female graduates and girls. The research followed the methodological descriptive way as it's more suitable to it, and to answer the questions of research and achieve the goals.
