

A comparative study on the role of fashion drawings for the design of women's clothing using CAD technology

Shereen Saied Mohamed Hasan

Faculty of Applied Arts, Helwan University

Abstract:

Fashion graphics of all kinds became the real beginning in creating a model and developing a piece of clothing; this process can be professionally used through utilizing the information of marketing and the researches in question so as to achieve the objectives and policy of the company. Sketches are commonly used for making a kind of communication between the design team and/or creating a spirit of communication between the design team and the rest of the production departments. You will find that each section of the related departments is somehow interested in implementing the clothing drawings in a way which basically accomplish its tasks on time taking into account the specifications required and going in line with the technical designs, so it is necessary to determine the specifications for each type of fashion drawings to achieve the planned targets. Consequently; the research problems began to appear for that reason. **The problem of research** can be formulated as follows: What is the possibility of identifying the types of fashion drawings in the field of fashion design? What is the significance of clothing design drawings in the field of fashion design and clothing industry? What is the difference between flat fashion graphics in the field of fashion design and production companies? What are the similarities and differences between flat fashion graphics in the field of fashion design and manufacturing of garment? What is the possibility of preparing drawings for the design of clothing of various types in the light of the procedural stages of fashion design? What is the possibility of setting standards for different types of clothing drawings in the field of fashion design for women? **This research aims** at achieving the following targets: - Clarifying the difference between the flat fashion graphics, and identify the similarities and differences between them, Drawing designs for women's clothing inspired by the international fashion trends of 2020/2021, and explaining the difference between designs in the procedural phases of implementing the fashion design, Implementation of the proposed design in the study and turning it into clothing pieces for women by using different types of fashion drawings. **The Results:** The results of the research are as follows: - Studying the different types of clothing design drawings in the fields of fashion design and the industry of garments. - Highlight the importance of each type of clothing design drawings, and its significant role in the areas of fashion design, and specialized companies. - Emphasize the differences between flat fashion drawings, and the importance of the procedural phases in implementing the fashion design. - Clarifying the difference between the flat fashion graphics, and identify the similarities and differences between them. - Clarifying the objective of drawing for each type of fashion design drawings. - Setting standards for each type of fashion design drawings.
